## Binoculars Explained

There are two basic styles of binocular - Roof prism and Porro prism - and either style is available in either Compact or Standard size.

### Roof Prism (DCF)

The two barrels are straight which makes the binoculars more compact and pocketable, although those with large hands might find the focus control a bit fiddly

### Porro Prism (ZCF)

The two barrels are offset into a 'Z' shape making the binoculars larger but easier to hold, especially for those with large hands

This number denotes the magnification factor

**8 x 42 DCF WP**

Some binoculars are also waterproof which is shown as WP

This number denotes the diameter of the objective lens

This denotes the prism type, DCF (roof prism) or ZCF (porro prism)

For general purpose viewing such as bird watching, a binocular with a 7 or 8-times magnification is recommended.

A standard size pair with a 32 or 42mm objective diameter will be brighter than a compact version with a 20 or 25mm objective.

As you increase the magnification, the brightness suffers; an 8 x 40 is generally brighter than a 10 x 50, despite the latter having a wider objective lens
